**Country's First Integrated Variable Data & Mail Solution
Can Reduce Postal Related Costs By Over 25%**

Santa Monica, CA. SynTel and XLPrint today announced the integration of their premier software packages, Automail® and Paris, to produce the first "one stop" form processing and mail management solution available in the United States.

"Any organization wishing to achieve the significant cost reductions available from employing CASS, PAVE and batch manifest certification to reduce their US Postal Service charges has always needed to integrate the mailing software with their form design and printing software" said Mr. Dean Peterson, CEO of XLPrint Software, USA. "By completely integrating SynTel's market leading "Automail®" package into the Paris Document Composition and Print Management tool we can now offer a one stop solution to design, print and mail certify any business document. This leads to the lowest possible production costs for both financial mail items such as invoices and also the rapidly growing 1:1, personalized mail application".

"Both SynTel and XLPrint exist to deliver maximum savings to users on printing and distributing documents" said Dave McOlgan, VP of Sales for SynTel, "yet, until now, integration of variable data print systems and mail certification solutions has been a specialist solution. By working with XLPrint as our exclusive OEM partner for the variable data market we have produced one solution that manages the design, production, finishing and mailing of documents in one process. This leads to the lowest possible costs and the simplest implementation."

"Despite the recent increases in postage costs many organizations have not taken advantage of the savings available from the US Postal Service" says Peterson "Too often the solution has been difficult to implement. By having one source, XLPrint, for the whole requirement, Finance Directors can now dramatically reduce their fixed charges and do so with confidence. In addition, organizations who want to lower their marketing costs should be looking at the 10 cents per item postal savings we typically deliver on direct mail pieces."

SynTel LLC of Jonesboro, Arkansas was founded in 1998 specifically to provide automated mail solutions. Their first product, version one of Automail® was released in 2000 and is now employed by over 1,000 of the Countries major financial institutions.

XLPrint Software USA of Santa Monica, California distributes a range of variable data solutions through major printing and solutions vendors. Founded in 1986 the Company has offices on all continents and customers in 55 Countries.
